

B. Specification Amendments

(0068) It should be noted that above method of operation for the isolation assembly is not restricted to the pressure testing operation of the straddle packer 10. For instance, when the straddle packer 10 is used for stimulating a formation, the cups 11 and 12 straddle the perforations in the casing. When the pressurized fluid is no longer supplied to the coiled tubing, the check valve closes because of the pressure differential, the pressure above the check valve being greater less than the pressure below. Further, as stated above, the isolation assembly including the check valve is not limited for use with a straddle packer; rather, the isolation assembly including the check valve is adapted for use with any downhole tool known to one of ordinary skill in the art having the benefit of this disclosure.
